Length Supply

Abodo’s Vulcan timber is produced and manufactured from natural wood and therefore has limitations and variability in length supplied. The plantation grown radiata pine logs used as base material are supplied from the forest in a mix of standard lengths, generally from 3.0m - 4.8m, heavy 4.2 or 4.8m. Shorter lengths are produced when the timber is cut back during sawmilling. Post sawmilling, Abodo’s manufacturing process produces timber as individual fixed lengths.

3.6 – 4.8m are our standard lengths. 2.7 & 3.0m are cut back lengths and we have less of these. Generally we’re heavy 4.2m or 4.8m.

5.4m and 6.0m we see less of and come through less often.

Our first priority is always to supply the exact lengths ordered. Alternative lengths would only be supplied when the requested stock is unavailable and the order would otherwise be delayed. In this situation Abodo reserves the right to supply lengths up to 600mm longer than specified (in 300mm increments) and charge accordingly. Where those lengths are unavailable, longer material may be trimmed back to the maximum applicable increment. Refer to Abodo’s current Consignment Policy.

Cladding may be supplied in LVG or ELVG formats. Refer to Vulcan Cladding Technical Data Sheet.

Selected shorts available for –15% off standard price.				Heavy 4.2 or 4.8m					5.4m and 6.0m are rare and not always available.
